

# A Call for Action

Did you know that the Canada lynx is 30 to 34 inches long? A Canada lynx male is 33.5 inches in length, while a female is 32 inches long. The Canada lynx is a medium sized cat who's threatened, and fewer than 100 remain in the U.S. Please join me as we learn more about why they're unique, about their habitat, and why they're threatened.

The Canada lynx has many features that redeem the cat as sui generis and it shows the beauty of this adorable yet somewhat perilous animal. A Canadian lynx is a medium sized cat with long legs and large furred paws, tufts on ears, a short tail with a black tip, a white-ish gray fur on belly, legs, and paws. This shows us how the cat is a one of a kind, like their black tipped tail. However this beautiful animal has a habitat that needs to be touched on.

The Canada lynx has a habitat that's really gorgeous yet undoubtedly easy to get lost in. The cat's habitat is in any Northern boreal forest in any where between Canada, Alaska, and Wisconsin. This could tell us so much about their food decisions, they eat Snowshoe hares and the occasional squirrel. Although this cute

feline is still here, they are vulnerable.

This enchanting creature is grandiose in every way but we aren't helping it. The Canadian lynx numbers have declined in the lower 48 states due to overlapping, as well as habitat loss, and fragmentation from logging. This tells us that so many people don't care for the environment, but we can try and fix that. And learning these things can really help the environment.

To conclude, I believe that the Canada lynx is a dazzling cat with a superb habitat and that it doesn't deserve to be jeopardized. We learned about how important it is to preserve this cat and how many there are. We should all at least try to come to an agreement on letting this amazing animal live. So, if you desire to, you can go and try to convince other people to keep this magnificent creature

alive.
