

Brilliant Ateles Paniscus

Ateles Paniscus is the scientific name of black spider monkeys. My first **glance** at a black spider monkey was an enormous surprise. Its eyes shone like the sun and its fur was **picturesque**. And that is why I am here to talk about black spider monkeys.

Here are some facts about black spider monkeys: if you do something interesting in front of a black spider monkey they might copy it, and if you **inspect** a black spider monkey closely you will see that the black spider monkey's tail is always hanging on something in case it falls.

Next, there are two threats that black spider monkeys are facing. The first threat is that when people make houses they often raze parts from the rainforest and it **disturbs** the black spider monkeys and **suspends** them from living there. The second threat is that some **wretched** hunters **ambition/aim** for black spider monkeys for money and fur. These two threats make black spider monkeys **struggle** to survive.

Right now they are vulnerable (taking a big risk of extinction in the world) , and it can get worse than that. If people don't care about the black spider monkey it will turn endangered then critically endangered and then extinct. If we don't save them now, these **graceful** and **elegant** creatures will be extinct.

It's actually super easy to help save snazzy black spider monkeys. You can buy a t-shirt or hat with black spider monkeys on it to support them. I think these black spider monkeys **merit** to survive. My **goal** is to save black spider monkeys. Let's save black spider monkeys!!!
