

How Tigers are being saved by conservation efforts

Everywhere tigers are dieing. No one can stop poaching and deforestation, except the bbgESA. The Endangered Spiecies Act(or ESA for short) prevents the destruction of the habitat and poaching of endangered animals. This combined with groups, like Tigers Forever, that helps tigers by making sure they are protected will help save tigers and increase their numbers.

First of all, one way conservation efforts are helping save tigers is by the ESA, which bans destroying endangered animals' habitat. According to A Brief Summary on the Endangered Species Act(ESA) it says that the ESA, " ... prohibits the destruction of their critical habitat," (Hodges). Tigers are endangered animals so this law is directed toward them. Also because tigers' habitat can't be destroyed they won't die of starvation. This is due to the fact that their habitat is not being destroyed so their prey is thriving. Not dying and having enough food will help increase their numbers. One way conservation efforts are helping save tigers is by the ESA banning the destruction of tigers' habitat

Next, another way conservation efforts are helping save tigers is another part of the ESA which bans poaching. The website titled A Brief Summary of the Endangered Species Act(ESA) says that the ESA bans poaching, (Hodges). Tigers are Apex predators. This means other animals won't hunt them. This brings their possible ways to die to be hunted by humans and things related to loss of habitat. This loss of habitat is already prevented by the ESA, so preventing poaching, the other main cause of tiger deaths, will help save tigers in the long run and ultimately will increase their numbers.

Lastly, a Final reason why coservation efforts are helping save tigers and increceing their numbers is due to programs likeTigers Forever. The website for the group called Tigers Forever

says that Tigers Forever is a conservation program that protects tigers by " monitoring populations of tigers and their prey, supporting counter-poaching efforts to secure protected areas, and connect and protect tiger habitats." (Tigers Forever). Due to the fact that Tigers are Apex predators, Humans are the only way they get hunted. Tigers Forever make Humans from tiger's worst enemy to their best friend. This is by making sure that their habitat is protected and they are not being poached, making it inevitable that tigers are going to grow in numbers. This is because a law stops most people from poaching ,but there still might be some poachers out there. Tigers Forever stop these people, which lets tigers repopulate more. By monitoring tiger population Tigers Forever can see if some tigers need to be put into captivity because their numbers are critically low. A last way conservation efforts save tigers is Tigers Forever, which makes sure that tigers are safe.

In conclusion, conservation efforts are helping save tigers in many ways. The ESA says that endangered animals, like tigers, can't be poached or have their habitat destroyed by humans. Also Conservation groups like Tigers Forever help protect tigers by making sure that poachers don't harm tigers and that their population is not too low. These efforts are just some of the many saving tigers. If humanity does not commit to saving tigers, history will repeat itself and the tigers will be gone forever.
